

Mixing Instructions:

Mix every 5kg bag of Nex-Pand with 1.5 litres of clean, cold water and stir

- 

1. Drill holes into the rock & clear.
- 

2. Space < 25cm apart, 90% deep.
- 

3. Mix Nex-Pand with water.
- 

4. Pour NexPand into your holes.
- 

5. Leave for 2-3 hours to set.

Nex-pand is a lime based product that will expand once it has been mixed the correct amount of water (1.5 liters/5kg bag) with each 5kg bag. Once thoroughly mixed, this mixture is then poured into pre-drilled holes in the rock, concrete, or reinforces concrete. This product will react over a period of time and will crack and break the rock, concrete or reinforced concrete. The reaction time is anything from a few hours (2-3 hrs) to a max of 24hrs.

The product comes in 3 types (all the same price):

- Type 1 - -5° to 10° (Winter Product)
- Type 2 - 10° to 25° (Summer Product)
- Type 3 - 25° to 40° (Extreme Summer Product)

Advantages:

1. Available “Off the shelf” to anybody (No special training required!)
2. Its Ultra Safe:-
 - a. No Noise
 - b. No Vibrations
 - c. No Gases
 - d. No Fly rock
3. Requires no permits for transport, storage and use thereof
4. Nex-pand is an Environmentally Friendly product :-
 - a. It creates no fumes and leaves no residue
 - b. Easily washes away with water
 - c. No damage whatsoever to surrounding property, buildings or installations
 - d. Ideal for sensitive areas

Disadvantages:

1. Nex-pand may take up to 24 hrs to react

Nex-pand Needs

The standard is to drill around 36/38mm holes. One could go to as small as a 32mm if you want. This is generally for deeper holes. It is not economical to drill bigger than around a 42mm to 45mm diameter hole, because the chemical will only blow out. (Most of the time)

We recommend that you start drilling a 30cm burden, in harder rock we suggest you go closer, to 25cm burden. The holes drilled need to be at least 90% of the depth of the rock you want to break, with no less than around 400mm deep.

For example:

- Length of the rock = 2m/0.30cm = around 7 holes
- Width of the rock = 3m/0.30cm = 10 holes
- Total holes = 10 x 7 = 70 holes to be drilled

Kilograms of our product needed = Number of holes X depth of the hole X factor (38mm hole) = 70 x 1.8m deep x 1.8kg of product needed = 226kg kg/ 20 = 11.34 ≈ 12 boxes of 20kg (come in 20kg boxes)
